MIT Press Ltd, United States, 2006. Hardback. Book Condition: New. 221 x 147 mm. Language: English . Brand New Book. These essays by Robert Schwartz on topics in the theory of vision are written from a pragmatic perspective. The issues and arguments will interest both philosophers and psychologists, covering new ground and bridging gaps between these disciplines. Schwartz begins historically, with discussions of problems raised and solutions offered in Bishop Berkeley s writings on vision, presenting Berkeley s views on spatial perception and the qualitative aspects of sensory experience in the context of recent theoretical and empirical work in vision theory. Schwartz then turns to debates in both the philosophical and psychological literature over the view that perception is inferential and thus indirect. Critically surveying competing characterizations of the idea of inferential processes he argues the need either to reframe radically the question or drop the issue. Next, Schwartz discusses pictorial representation and research on picture perception. Drawing on the work of Nelson Goodman, Schwartz explains and defends the advantages of a symbolic approach to both topics. Finally, he examines the quagmires that often develop when metaphysical concerns about the real and our ability to perceive it infect discussions and claims in the theory of vision. After analyzing issues arising in current psychological research on object perception, Schwartz turns to debates over the supposed essential nature of colors. An appreciation of the empirical and theoretical work on color perception suggests that there is no single or privileged analysis of the notion of real colors. Schwartz circles back in the end to what he calls that old chestnut of the philosophy of perception -- controversies over the objects of perception -- and takes an Austinian look at the topic.
