RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 198 pages. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1921 Excerpt: . . . because the rough surface presented in Fig. 1 is not one of minimum potential energy. If anything tends to disturb the equilibrium it must be considered. There is one thing. I refer to the weight of the column of water sustained and believe that it would tend to slip the quartz grains along the film to bulk-water. As a result the skewbacks for the arch would be continually dropping back into the water (see Fig. 4), at a rate depending on viscosity and other factors. The weight of the grains themselves would also tend to produce this slipping. As for viscosity, we know that quartz would drop back faster in a film of low viscosity and that viscosity decreases with rise of temperature. Heat should therefore improve the grade of con Fig. 4. --A Bubble Spilling Quartz Back into the Water. centrare. While there might well be causes which would neutralize this effect it is interesting to associate, in this connection, a paragraph from Dr. Gahls paper⁵ that reads as follows: How can we raise the grade of our concentrates--that is, reduce the percentage of insoluble matter contained in them--without entailing additional copper losses We know from laboratory experiments that this can be done by expensive methods, for instance, by heating the solutions. Would not heating the froth only, with steam-coils, effect the same advantage at much less cost By the use of fundamental principles of physics I have adduced considerations that are in accord with colloid chemistry, namely, solids armor...
